BLACK-FOOTED FERRET SURVEY REPORT
ROCKY MOUNTAIN ARSENAL
September 1987

1.0 INTRODUCTION

Black-footed ferret surveys were initiated at Rocky Mountain Arsenal (RMA) in response to U.S. Fish and Wildlife Service (USFWS) comments on the proposed land development and pest management programs at RMA, and concerns regarding contamination and cleanup at RMA. This report addresses black-footed ferret surveys in all black-tailed prairie dog towns within the boundaries of RMA. Surveys were conducted in accordance with the USFWS guidance for conducting such surveys (Black-Footed Ferret Guidelines for Compliance with the Endangered Species Act, USFWS, March, 1986). This report summarizes the results of all surveys, and is submitted to the U.S. Fish and Wildlife Service in order to provide a basis for evaluating actions related to the cleanup of RMA and to evaluate proposed pest control programs on RMA.

To determine the historical occurrence of black-footed ferrets in eastern Colorado, experts from the Colorado Division of Wildlife (CDOW) and the USFWS were contacted. The last confirmed record of a black-footed ferret in eastern Colorado is from a ferret live-trapped in the Green Mountain vicinity in 1949 or 1950 and kept in captivity by the USFWS until 1955 (Besser, pers. comm). Other unconfirmed sightings are noted from:

- o End of Stapleton International Airport runways, late 1970's;
- o Nunn (Weld County), 1979;
- o Pawnee National Grassland, 1976; and
- o Buckley Air National Guard Base (probably domestic ferrets) Schroeder, pers. comm).

The CDOW had no other sightings of black-footed ferrets on record (Sheppard, pers. comm).

2.0 SURVEY METHODOLOGY

Recent aerial photography (October 1986) at a scale of 1 in = 500 feet (ft) of RMA was obtained. Prairie dog towns were mapped, and the maps

subsequently ground-truthed to verify the distribution of prairie dog towns prior to conducting surveys. Prairie dog town locations and areas surveyed are shown in Figure 1.

Black-footed ferret surveys were conducted between July 1 and September 10, 1987. Surveys took place between dusk and dawn, the times for which varied through the season. Starting and ending times per area surveyed are shown in Table 1.

Areas to be surveyed were divided into tracts of approximately 300 acres. Each team was responsible for one tract over a three night period. Total time of spotlight search varied from 5 to 8 hours, depending on the time required to complete one search of each \pm 300-acre tract. Abbreviated daytime surveys of each tract were made to flag tract areas and look for ferret sign prior to commencement of nighttime survey work. These surveys served the additional purpose of locating any obstacles which could cause damage to vehicles and/or injury to survey personnel. Potential obstacles were flagged in order to be visible at night.

Each tract was surveyed during three shifts per night: shift 1 began at dusk (2000 to 2100 hours), shift 2 began between 0000 and 0100 hours, and shift 3 began around 0230 hours. Searches of each tract took an average of 2 to 2 hours to complete. Every search began at different starting points during the night in order to maximize coverage of the area during different time periods. Two survey teams were used each night to maximize nightly coverage and for safety reasons. Each team consisted of two people, at least one of which had completed the USFWS Black-footed Ferret Certification Course.

Each team was equipped with at least two 200,000 candle power lamps which were operated from the vehicles' specially modified electrical system. Sealed batteries were carried as back-up power sources. One vehicle was equipped with four 200,000 candle power lights mounted on a overhead rack. The team in the other vehicle used a 400,000 candle power lamp as one of their light sources. By using two lamps per vehicle, the width of transects

illuminated was approximately 0.1 mile. A compass was used to maintain course where distant stationary light sources were not available to use as navigation points.

3.0 RESULTS AND CONCLUSIONS

No black-footed ferret sign was observed and no ferrets were seen during the course of preliminary daytime and more intense nighttime surveys. It is therefore presumed that no black-footed ferrets will be impacted by proposed activities within the boundaries of RMA.
